Q1: What is the primary function of photosynthesis in plants?

Q2: Where does the ATP process occur in plant cells?

Q3: What ions are directly involved in the ATP process of photosynthesis?

Q4: What role do K^+ and Na^+ ions play in plant cells?

Q5: What is the primary energy currency of plant cells?

Q6: What is the function of stomata in plant leaves?

Q7: How do K^+ ions affect stomatal opening and closing?

Q8: What happens to stomatal function when Na^+ ions are present in high concentrations?

Q9: Why is the regulation of stomatal aperture important for plants?

Q10: Describe the relationship between light energy and ATP production in photosynthesis

Q11: Explain the role of the electron transport chain in ATP production

Q12: What is the outcome of the Calvin cycle, and how is it related to ATP production?

Q13: How do plants regulate their water balance, and what role do stomata play in this process?
